

Directions: You must show all steps required to arrive at the correct answer for the problem below.

1. (12 points) A spooky ghost of mass $M = 40 \text{ kg}$ is rest at the origin at time $t = 0$ when it is subjected to a spooky force that results in its position being given by the function $x(t) = 4t^2 + 4\sqrt{t}$

a) Calculate the instantons force on the ghost at time $t = 4 \text{ s}$.

b) At time $t = 4 \text{ s}$, the spooky force is removed and the ghost is now subject to a resistive force given by $F_{DRAG} = -8v^2$. Taking this as the new time $t = 0 \text{ s}$, write a function for the velocity of the ghost as a function of time. You can leave your final answer as a function of $\frac{1}{v(t)}$.

2. (8 points) A block of mass M is placed on an incline that makes an angle of θ with the horizontal because this is a physics test and of course it was going to have a block placed on an incline. The interface between the block and the incline has a coefficient of static friction, μ_s , and a coefficient of kinetic friction, μ_k . The block is now pulled down the incline with a force of magnitude F that acts parallel to the ground as shown.

a) Draw a free-body diagram of the forces on the block.

b) Determine tan expression for the acceleration of the block down the incline.

3. (10 points) A block of mass M rests on a rough horizontal surface with a coefficient of static friction, μ_s , acting between the surface and block. A force of F acts downward on the block at angle of θ with the horizontal as shown.

a) Show that the minumum value of F that will move the block is given by

$$F = \frac{\mu_s M g}{\cos\theta - \mu_s \sin\theta}$$

b) Explain why the block will not move if the value of θ is too large regardless of how strong the pushing force is.

4. (6 points) Consider the pulley system shown. Two blocks of masses $3M$ and M rest on a horizontal table with a coefficient of kinetic friction, μ . A string is connected to the block of mass $3M$ which passes over a frictionless pulley and connects to a hanging block of mass $4M$. The system is set into motion, with the hanging block pulling the $3M$ block which then pushes the block of mass M . Determine an expression for the magnitude of the force that the block of mass M exerts on the block with mass $3M$.

5. (8 points) A mass M rests on a rough horizontal surface. The coefficient of sliding friction between the block and the surface is μ . A block of $2M$ is on top of the block of mass M and is given an initial velocity of v_0 at time $t = 0$ s. The coefficient of friction between the two blocks is 4μ . The bottom block starts at rest and the following are known: $v_0 = 10 \frac{m}{s}$, $\mu = 0.2$, $M = 1.0 \text{ kg}$.

- Write a velocity vs. time function for the top block.
- Write a velocity vs. time function for the bottom block.

6. (8 points) A block of mass 10 kg initially at rest is pushed against a wall by a force of magnitude F as shown. The force acts at an angle of 60° with the horizontal. The coefficient of kinetic friction is $.3$ while the coefficient of static friction is $.5$.

- Draw a free-body diagram of all the forces on the block if the block slides up the wall.
- Determine the value of F for the block to slide up the wall at constant speed.

7. (12 points) A Hyundai Elantra of mass $M = 1000 \text{ kg}$ initially at rest and is propelled by a constant forward force provided by its motor, $F_M = 400 \text{ N}$. The car moves in the direction indicated along a horizontal road. While moving, the car encounters a resistance force equal to $-2v$, where v is the velocity of the car

- Write and solve a differential equation to obtain an expression for the velocity of the car as a function of time.
- Use your answer to a) to derive an expression for the acceleration of the car as a function of time.

8. (14 points) Patrick hones his yo-yoing skills while waiting for milk to heat up. Assume that the mass of the yo-yo string is negligible, and the plastic part of the yo-yo has a mass of $M = 0.5 \text{ kg}$.

- First, Patrick tries spinning; that's a good trick. He spins the yo-yo in a vertical circle as shown with a $R = 0.6 \text{ m}$. At a certain point, the yo-yo string makes an angle of $\theta = 30^\circ$ with vertical as shown, and it is in the lower right part of its motion.

At this point, the tension in the rope is found to be 320 N . Calculate the components of the yo-yo's total acceleration (tangential and radial) at this point.

- In another feat of yo-yoing, Patrick whirls the yo-yo in a horizontal motion by swinging the yo-yo above his head as shown, forming a conical pendulum. The yo-yo string makes an angle of $\theta = 45^\circ$ with horizontal and the yo-yo travels in a horizontal circle with radius $R = 0.6 \text{ m}$. Calculate the speed of yo-yo.
